

ARBORY DORMERS

Standard Features and Benefits

INHERENT STRENGTH

The high strength-to-weight ratio of GRP and its resistance to corrosion result in a strong, relatively lightweight and weatherproof alternative to traditional dormer construction methods.

INSULATION

All dormers are fully insulated to current standards by encapsulating fire retardent polyurethane foam between the inner and outer GRP skins. This ensures no interstitial condensation without the need for a vapour barrier or ventilation.

FAST INSTALLATION

Arbory Dormers are quickly and easily installed (full instructions provided) and are immediately weatherproof and ready for other trades to follow on with roof finishes. Being moulded as one piece units with integral gutters, Arbory Dormers eliminate many of the awkward details and flashings associated with traditional construction methods reducing the number of skilled trades and time on site.

INTEGRAL GUTTERS

Gutters and valleys are moulded integrally to each unit so that lead flashings, valleys, soakers and special tiles are not required around the top and sides.

PRE-FINISHED EXTERIOR

Arbory Dormers are supplied with weatherproof external finishes to simulate traditional materials such as lead, render etc. or ready to accept tiling.

MAINTENANCE FREE

All internal and external finishes are maintenance free but can also be decorated using conventional methods. Trojan Dormers eliminate leak-prone joints ensuring excellent long term weathering.
